

HostelApp: an application for the hostel Sparkling Water

Command-line & desktop modules

Java SE edition

The Vision for the Software product named HostelApp

Vision of the HostelApp

Vision for the product "HostelApp"

For a Startup aiming to provide software solutions to hostels
that wants to become known worldwide,

The HostelApp is a cloud solution proposed for educational purposes.

Differently from the several other proprietary solutions, HostelApp is FREE and
OPEN-SOURCE.

Create a Guest User Story

Create a guest user story

US-1210: Create a guest

As a **Reservation Manager** I want to **create a guest** in order to **keep a history of all guests who have been in the Sparkling Water Hostel** since its inauguration.

Acceptance criteria for Create a Guest US

US-1210: Acceptance criteria

- A **guest** has the following fields: **title**, **first name**, **last name**, **address**, **zip-code**, **city**, **state**, **country**, **date of birthday**, **email**.
- Possible values for **title**: **Mr.**, **Mrs.**, **Miss.**, **Ms.**, **Dr.**
- The **title**, **name**, **last name**, **address**, **state**, **zip-code**, **country**, and **email** fields are **required** and **cannot be empty**.
- The name must be **at least 2 characters**
- The **Reservation manager** must be notified when a literal in a field violates the rules (**required**, **number of chars**, **mandatory fields**, etc)
- Just after creation of a **guest**, a **list with all guests** must be shown including the **name** of the **new created guest** and an option to **edit** or **make a reservation** for each **guest**
- The system must verify Invalid date format (the format for dates used in the system is YYYY/MM/DD)
- The **same guest cannot** be created **twice**. A message "**guest already exists**" must be shown in this case. A guest can be uniquely identified by it's **name** + **last name** + **e-mail**.

Create a Guest user story

US-1210: Create a guest

As a **Reservation Manager** I want to **create a guest** in order to **keep a history of all guests who have been in the Sparkling Water Hostel** since its **inauguration**.

US-1210: Acceptance criteria

- A **guest** has the following fields: **title, first name, last name, address, zip-code, city, state, country, date of birthday, email**.
- Possible values for **title**: **Mr., Mrs., Miss., Ms., Dr.**
- The **title, name, last name, address, state, zip-code, country, and email** fields are **required** and **cannot be empty**.
- The name must be **at least 2 characters**
- The **Reservation manager** must be notified when a literal in a field violates the rules (**required, number of chars, mandatory fields, etc**)
- Just after creation of a **guest**, a **list with all guests** must be shown including the **name** of the **new created guest** and an option to **edit** or **make a reservation** for each **guest**
- The system must verify Invalid date format (the format for dates used in the system is YYYY/MM/DD)
- The **same guest cannot** be created **twice**. A message "**guest already exists**" must be shown in this case. A guest can be uniquely identified by its **name + last name + e-mail**.

The Guest class

Classes are nouns

User story: Create a guest

As a Reservation Manager I want to **create** a guest in order to **keep a history of all guests** who have been in the Sparkling Water Hostel since its inauguration.

Guest

+ name : String
+ lastName: String

US-1210: Acceptance criteria

- A **guest** has the following fields: **title**, first name, last name, **address**, **zip-code**, **city**, **state**, **country**, **date of birthday**, **email**.
- Possible values for **title**: **Mr.**, **Mrs.**, **Miss.**, **Ms.**, **Dr.**
- The **title**, **name**, **last name**, **address**, **state**, **zip-code**, **country**, and **email** fields are **required** and **cannot be empty**.
- The name must be **at least 2 characters**
- The **Reservation manager** must be notified when a literal in a field violates the **required**, **number of chars**, **mandatory fields**, etc)
- Just after creation of a **guest**, a **list with all guests** must be shown including the **new created guest** and an option to **edit** or **make a reservation** for each guest.
- The system must verify Invalid date format (the format for dates used in the system is YYYY/MM/DD)
- The **same guest cannot** be created **twice**. A message "**guest already exists**" must be shown in this case. A guest can be uniquely identified by its **name** + **last name** + **e-mail**.

Classes are derived from english nouns. Here, we underlined **candidate nouns** to become **classes**. One tip is to **verify** if the **noun** is **consisted of parts**. If so, it is probably a **class**. Since **Guest** has a **name**, **address**, and others "parts", we chose it to become a **class**.
